Study Published in the American Journal of Cosmetic Surgery Declares VASER® Shape

“A Novel Approach to Achieve Immediate Anatomical Circumferential Reduction in a Noninvasive Way and with No Patient Downtime or Discomfort.”

A study involving 204 patients, who received 741 treatment sessions at 12 different facilities across the United States, was published in the June edition of the American Journal of Cosmetic Surgery, the official publication of the American Academy of Cosmetic Surgery. The study is the first of its kind to demonstrate statistically significant and clinically relevant data that supports what many physicians who use the system have been experiencing for over two years.

Key findings of the published study:

- Immediate circumferential reduction in the abdomen and thighs
- Circumferential reduction continued over the course of treatments
- No analgesics or anesthesia was provided to patients before or during treatment
- Patients reported pleasant treatments that felt warm but not uncomfortable
- Patients able to continue with normal daily routines after treatment
- Patients reported clothes fit better after treatment
- Patients reported feeling tighter in the treated area
- Patients reported treated areas had smoother skin
